START SAVING TIME

I want to make a webservice request asynchron. I call it here:

25 `List<Item> list = GetListAsync();`

Here is the declaration of my function, which should return a list:

3

```
private async Task<List<Item>> GetListAsync(){
    List<Item> list = await Task.Run(() => manager.GetList());
    return list;
}
```

If I want to compile I get the following error

Cannot implicitly convert type System.Threading.Tasks.Task<System.Collections.Generic.List<I

As I know if I use the `async` modifier the result is automatically wrapped with `Task`. I think this doesn't happen because I use `Task.Run`. If I remove the `Task.Run()` => part I get

Cannot await System.Collections.Generic.List expression

I think I haven't fully understood the `async/await` methods. What I'm doing wrong?

c# list asynchronous async-await task

You need to correct your code to wait for the list to be downloaded:

53 `List<Item> list = await GetListAsync();`

Also, make sure that the method, where this code is located, has `async` modifier.

The reason why you get this error is that `GetListAsync` method returns a `Task<T>` which is not a

completed result. As your list is downloaded asynchronously (because of `Task.Run()`) you need to "extract" the value from the task using the `await` keyword.

If you remove `Task.Run()`, your list will be downloaded synchronously and you don't need to use `Task`, `async` or `await`.

One more suggestion: you don't need to `await` in `GetListAsync` method if the only thing you do is just delegating the operation to a different thread, so you can shorten your code to the following:

```
private Task<List<Item>> GetListAsync(){
    return Task.Run(() => manager.GetList());
}
```

They will also need to ensure that the method calling this code is made an `async` method (if they haven't already). – Daniel Kelley Sep 8 '14 at 9:26

What I don't get is why do I have to `await` two times? – testing Sep 8 '14 at 9:27

@testing, you have to `await` twice because you have 2 `async` calls – Ben Robinson Sep 8 '14 at 9:28

@BenRobinson: Do I have two `async` calls or only one (and the second is for "extracting")? – testing Sep 8 '14 at 9:33

1 @testing You have 2, you are awaiting the task in your `GetListAsync` method, then you are awaiting the method itself in your calling code – Ben Robinson Sep 8 '14 at 9:35

add a comment

10 In addition to @takemyoxygen's answer the convention of having a function name that ends in `Async` is that this function is truly asynchronous. I.e. it does not start a new thread and it doesn't simply call `Task.Run`. If that is all the code that is in your function, it will be better to remove it completely and simply have:

```
List<Item> list = await Task.Run(() => manager.GetList());
```

I also have a `try/catch` block to catch the exceptions and I'm showing a spinner. So my method name is correct than? – testing Sep 8 '14 at 11:45

yes i think it should be OK, starting a new thread is not ideal but i think the guideline is more about calling a synchronous version of the function inside `Task.Run` – Ned Stoyanov Sep 9 '14 at 9:35

add a comment

Works for me:

3

```
List<Item> list = Task.Run(() => manager.GetList()).Result;
```

in this way it is not necessary to mark the method with `async` in the call.

▲ Instead of doing all these, one can simply use "Result" to get the result from a particular task.
-1 eg: List list = GetListAsync().Result;
▼ Which as per the definition => Gets the result value of this Task < TResult >
